

Fatih Sultan Mehmet Vakıf University
Faculty of Engineering
Department of Computer Engineering

Course Name: Programming for Data Engineering

Instructor name: Dr. Öğr. Üyesi Abdülkerim Mohammed YİBRE

In this project, students are required to design and develop the system based on the titles shared with you recently

Objective: -

- Understand very well the use of Python in solving real-world problems
- Implement theoretical and practical concepts discussed in class and lab session
- Design and develop systems that can solve problems
- Know the rules and syntax of Python, designing interface, connecting system with database.
- To expose students to do group projects and learn to share tasks and responsibilities.

Students shall take into consideration the following.

1. Each student in the group should have active participation and be well-aware of their project. Unable to do so may lead to differentiation in the grading of the project
2. Students shall document the objectives, the functionalities of their project
3. Students are required to use Python programming language and Python tools to implement the project
4. The system should have Graphical User Interface (GUI) and Database
5. The final project should have at least 15 classes
6. Your project shall have modules and implement the requirements based on your project topic
7. Students shall prepare a functioning system based on the project titles
8. The deadline for project submission is **May 5, 2026, 23:59.**
9. The demonstration or presentation will be after the submission.
10. Each group member should submit the final project (the code and the documentation in PDF format) separately. The file shall be named as : *Fullname_IDNO_DB_projecttitle.*
11. The project presentation dates (tentative) starts on **May 6, 2026**
